Experiment 5: Mobile Application Wireframe with Localization Features Using Figma

Aim

To design a mobile application wireframe in Figma that incorporates localization features such as language selection, location access, regional settings, and localized content for a better user experience.

Algorithm

Open Figma and create a new design file.

Create a mobile-sized frame, such as iPhone/Android screen.

Design the Welcome/Home Screen with the application name, location, and main options.

Add a Language Selection option with languages such as English, Tamil, Hindi, and Telugu.

Add a Location Selection option to allow the user to select their city or region.

Add a GPS/Current Location option for detecting the user's current location.

Create a Regional Settings screen containing:

Language

Country/Region

Time Zone

Date Format

Currency

Create separate screens for Home, Location, Language, and Settings.

Add buttons, icons, dropdowns, and navigation elements using Figma shapes and components.

Open the Prototype tab in Figma.

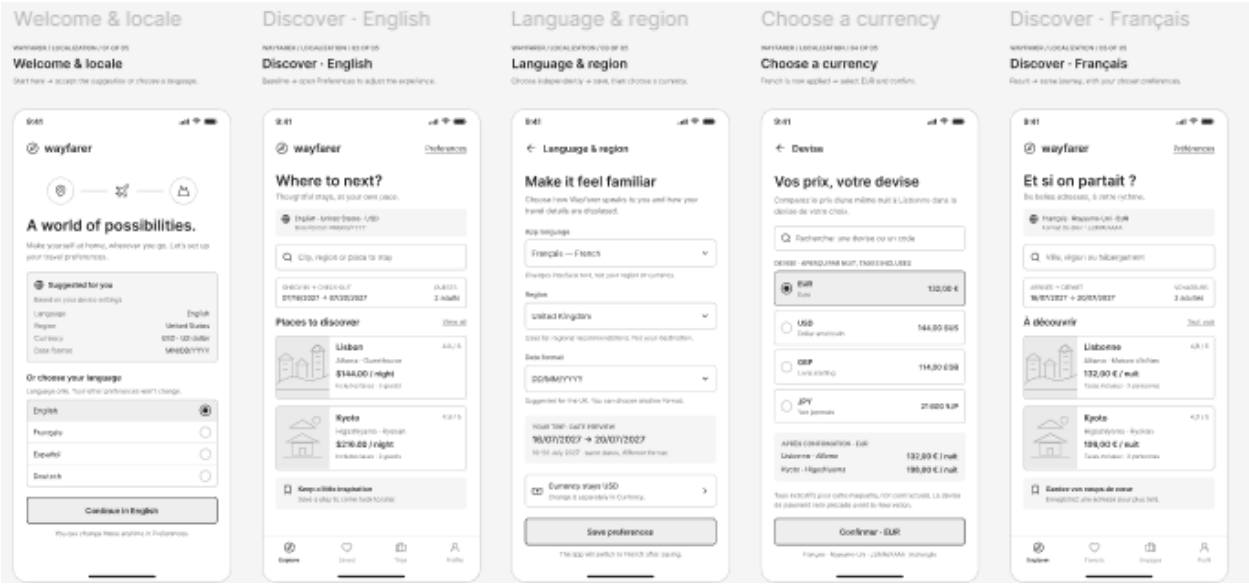
Connect buttons using On Click → Navigate to.

Connect the language button to the Language Selection screen.

Connect the location button to the Location Selection screen.

Connect the Settings button to the Regional Settings screen.

Preview the prototype and verify that all localization features work correctly.\



Result

A mobile application wireframe with localization features was successfully designed in Figma. The wireframe provides language selection, location detection, regional settings, and easy navigation, allowing the application to adapt to users from different regions and languages.
