Experiment 6: Mobile Network Handoff Simulation Using Figma

Aim

To use Figma to simulate and visualize the handoff process in a mobile network, showing how an active mobile connection is transferred from one cell/base station to another while the user moves.

Algorithm

Open Figma and create a new design file.

Create a frame titled “Mobile Network Handoff Simulation.”

Draw two adjacent coverage areas:

Cell 1 – Base Station A

Cell 2 – Base Station B

Place a Mobile Station (MS) inside Cell 1.

Draw a communication link between the mobile device and Base Station A.

Show the mobile device moving toward Cell 2 using arrows.

Add a Signal Strength indicator that decreases from Base Station A as the device moves away.

Show Base Station B detecting a stronger signal.

Add a decision point: “Is Target Cell Signal Stronger?”

If No, continue communication with Base Station A.

If Yes, initiate the Handoff Request.

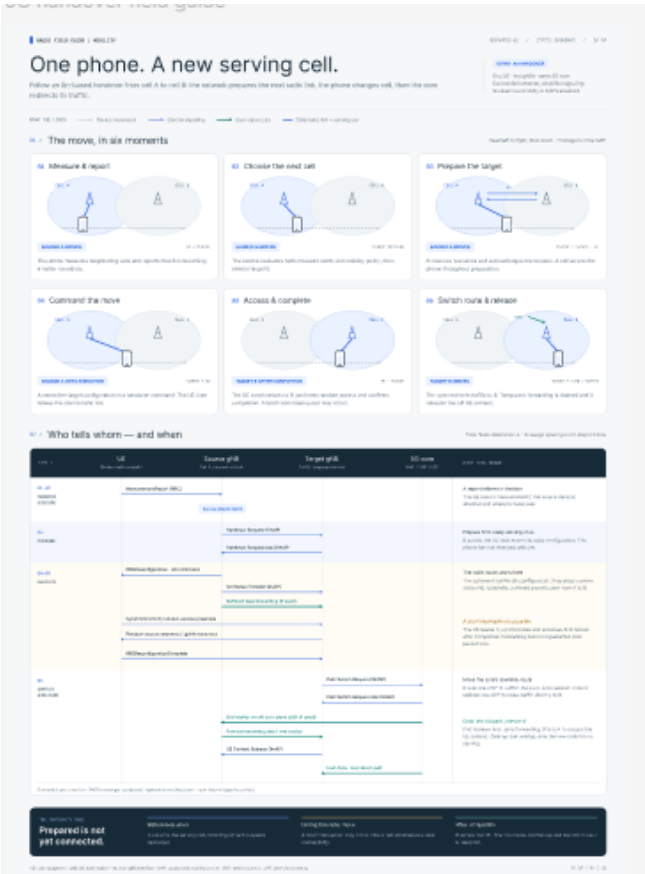
Transfer the connection from Base Station A to Base Station B.

Show the mobile device connected to Base Station B.

Use Figma Prototype mode to connect the screens using On Click → Navigate to.

Use Smart Animate to create a simple movement effect for the mobile device.

Preview the prototype and verify the complete handoff process.



Result

The mobile network handoff process was successfully simulated in Figma. The prototype visually demonstrates how an active mobile connection is transferred from Base Station A to Base Station B when the user moves between coverage areas, while maintaining continuous communication.
