Experiment 7: Cellular System Performance Dashboard Using Figma

Aim

To develop a dashboard prototype in Figma that displays important performance criteria of a cellular system, such as network availability, signal strength, call success rate, dropped calls, data throughput, latency, and active users.

Algorithm

Open Figma and create a new design file.

Create a desktop frame for the Cellular Network Performance Dashboard.

Add a header containing:

Dashboard title

Network name

Date and time

Network status

Create KPI cards for important performance parameters.

Add a Network Availability card showing the percentage of network availability.

Add a Call Success Rate card showing successful calls.

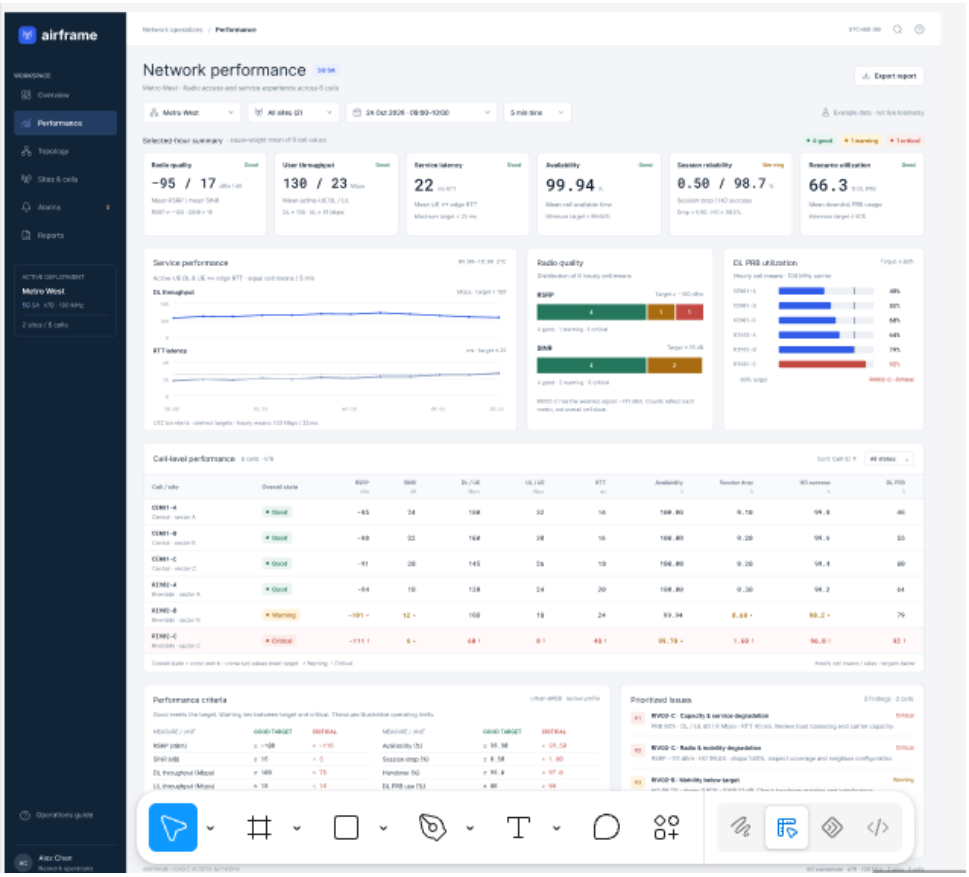

Add a Dropped Call Rate card.

Add a Data Throughput card showing the average data speed.

Add a Latency card showing network response time.

Add an Active Users card showing the number of connected users.

Preview the dashboard and verify that all performance criteria are clearly displayed.

Result

A cellular system performance dashboard prototype was successfully designed in Figma. The dashboard visually displays important performance criteria including network availability, call success rate, dropped calls, throughput, latency, signal strength, active users, and cell status, allowing network performance to be monitored easily.
