9. User Interface Prototype for a GSM Service Using Figma

Aim

To design a user interface prototype in Figma for a Global System for Mobile Communications (GSM) service.

Procedure

Open Figma and create a new mobile application design file.

Create a mobile screen with a GSM service application title.

Design a home screen containing options such as Make a Call, Send SMS, Contacts, Network Status, and Balance Information.

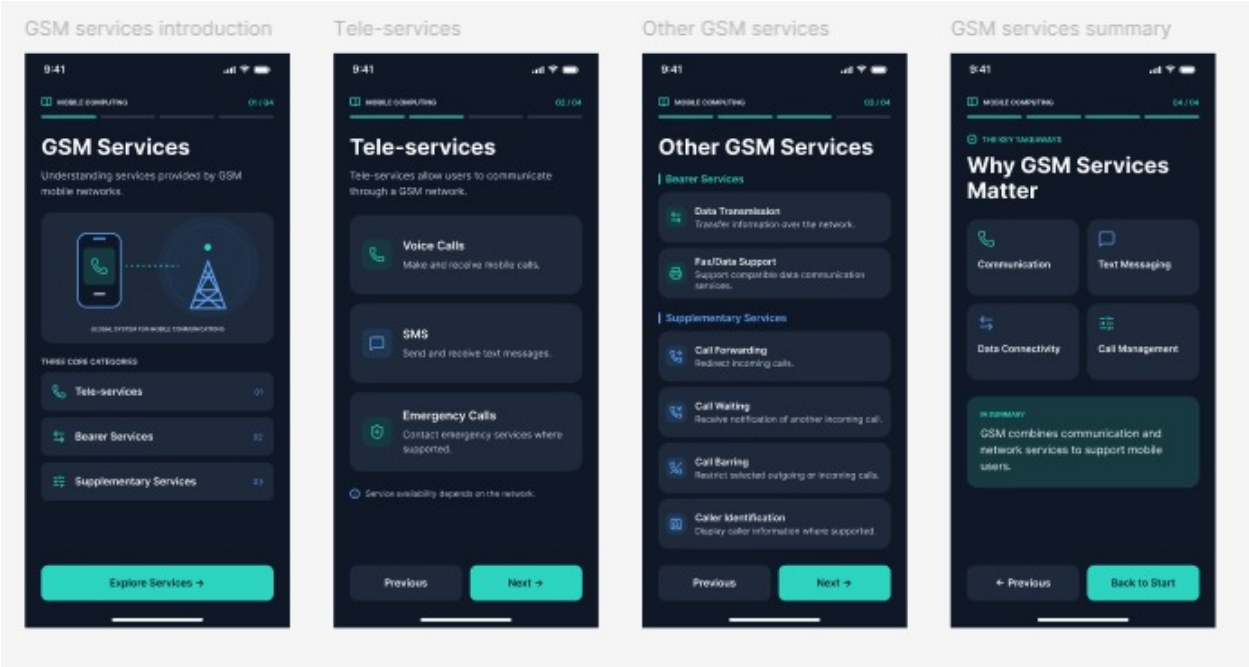

Create additional screens for the dial pad, messaging interface, contacts list, and network status.

Add icons, buttons, text fields, and navigation controls.

Apply a consistent color scheme, typography, and mobile-friendly layout.

Use Figma's prototyping feature to link buttons to their corresponding screens.

Test the prototype by navigating through the screens in presentation mode.

Result

A GSM service user interface prototype was developed in Figma, demonstrating the navigation and screen designs for calling, SMS, contacts, and network status. The prototype represents the user experience and does not implement actual GSM network functionality.
